

WHAT IS CLAIMED IS:

1. An image reproducing apparatus, comprising:

a selecting device that selects a file from a storage medium storing both files of still images and files of moving images;

a first display that displays a still image on an image monitor when the file selected by said selecting device contains image data of the still image;

a second display that displays a frame of a moving image on the image monitor when the file selected by said selecting device contains image data of the moving image, a display style of the frame of the moving image being different from that of the still image; and

a third display that displays the moving image on the image monitor if a user operates said image reproducing apparatus for moving image reproduction when the frame of the moving image is being displayed on the image monitor by said second display.

2. The image reproducing apparatus as defined in claim 1, wherein said second display displays perforations on both sides of the frame of the moving image.

3. The image reproducing apparatus as defined in claim 1, wherein said second display shakes the frame of the moving image.

4. An image reproducing apparatus, comprising:

a selecting device that selects a file from a storage medium storing both files of still images and files of moving images;

a first display that displays a still image on an image monitor when the file selected by said selecting device contains image data of the still image;

a second display that consecutively and repeatedly displays frames of a moving image on the image monitor when the file selected by said selecting device contains image data of the moving image; and

a third display that displays the moving image on the image monitor if a user operates said image reproducing apparatus for moving image reproduction when the frames of the moving image are being displayed consecutively and repeatedly on the image monitor by said second display.

5. An image reproducing apparatus, comprising:

an index reproduction setting device that selects files from a storage medium storing both files of still images and files of moving images and sets index reproduction; and

a display that constructs index images of the still images and the moving images of the files selected by said index reproduction setting device according to image data of the files and displays the index images on the image monitor when said index reproduction setting device sets the index reproduction, a display style of the index image of the moving image being different from that of the index image of the moving image.

6. The image reproducing apparatus as defined in claim 5, wherein said display displays perforations on both sides of the index image of the moving image.

7. The image reproducing apparatus as defined in claim 5, wherein said display shakes the index image of the moving image.

8. The image reproducing apparatus as defined in claim 5, further comprising:

a device that displays the still image on the image monitor when the still image is selected by said selecting device and displays the moving image on the image monitor when the moving image is selected by said selecting device.

an index reproduction setting device that selects files from a storage medium storing both files of still images and files of moving images and sets index reproduction; and

10. The image reproducing apparatus as defined in claim 9, further comprising:

a selecting device that selects a still image or a moving image according to the index images of the still images and the moving images displayed on the image monitor; and

a device that displays the still image on the image monitor when the still image is selected by said selecting device and displays the moving image on the image monitor when the moving image is selected by said selecting device.

11. A digital camera that records and reproduce still images and moving images, said digital camera comprising:

a selecting device that selects a file from a storage medium storing both files of the still images and files of the moving images;

a first display that displays a still image on an image monitor when the file selected by said selecting device contains image data of the still image;

a second display that displays a frame of a moving image on the image monitor when the file selected by said selecting device contains image data of the moving image, a display style of the frame of the moving image being different from that of the still image; and

a third display that displays the moving image on the image monitor if a user operates said image reproducing apparatus for moving image reproduction when the frame of the moving image is being displayed on the image monitor by said second display.

12. A digital camera that records and reproduce still images and moving images, said digital camera comprising:

a selecting device that selects a file from a storage medium storing both files of the still images and files of the moving images;

a first display that displays a still image on an image monitor when the file selected by said selecting device contains image data of the still image;

a second display that consecutively and repeatedly displays frames of a moving image on the image monitor when the file selected by said selecting device contains image data of the moving image; and

a third display that displays the moving image on the image monitor if a user operates said image reproducing apparatus for moving image reproduction when the frames of the moving image are being displayed consecutively and repeatedly on the image monitor by said second display.

13. A digital camera that records and reproduce still images and moving

images, said digital camera comprising:

an index reproduction setting device that selects files from a storage medium storing both files of the still images and files of the moving images and sets index reproduction; and

a display that constructs index images of the still images and the moving images of the files selected by said index reproduction setting device according to image data of the files and displays the index images on the image monitor when said index reproduction setting device sets the index reproduction, a display style of the index image of the moving image being different from that of the index image of the still image.

14. A digital camera that records and reproduce still images and moving images, said digital camera comprising:

an index reproduction setting device that selects files from a storage medium storing both files of the still images and files of the moving images and sets index reproduction; and

a display that constructs index images of the still images and the moving images of the files selected by said index reproduction setting device according to image data of the files and displays the index images on the image monitor when said index reproduction setting device sets the index reproduction, said display shaking the index image of the moving image.

15. An image reproducing apparatus, comprising:

a selecting device that selects a file from a storage medium storing files of moving images;

a first display that displays an image related to the moving image on an image monitor;

a moving image reproduction setting device that sets moving image

reproduction; and

a second display that displays the moving image of the file selected by the selecting device on the image monitor when moving image reproduction is set by the moving image reproduction setting device.

16. The image reproducing apparatus as defined in claim 15, wherein:
the image related to the moving image is composed of frames of the beginning part, the middle part and the end part of the moving image; and
the first display displays the frames together or sequentially.
17. The image reproducing apparatus as defined in claim 15, wherein:
the storage medium stores files of still images; and
the first display displays a still image on the image monitor when the still image is selected by the selecting device.
18. An image reproducing apparatus of a digital camera that records still images and moving images in a storage medium, said image reproducing apparatus comprising:
a selecting device that selects a file from the storage medium storing files of the still images and files of moving images;
a first display that displays an image related to a moving image on the image monitor when the file selected by the selecting device contains image data of the moving image and displays a still image on the image monitor when the file selected by the selecting device contains image data of the still image;
a moving image reproduction setting device that sets moving image reproduction when the image related to the moving image is being displayed on the image monitor; and
a second that displays the moving image on the image monitor when the

moving image reproduction is set by the moving image reproduction.

19. An image reproducing apparatus, comprising:

a selecting device that selects a file of an image from a storage medium storing files of images with sound;

a choosing device that chooses between image reproduction with the sound and image reproduction without the sound; and

a reproducing device that reproduces the image and the sound when the choosing device chooses the image reproduction with the sound and reproduces only the image when the choosing device chooses the image reproduction without the sound.

20. The image reproducing apparatus as defined in claim 19, wherein:

the storage medium stores files of images without sound; and

the reproducing device reproduces the image and the sound only when the selecting device selects the image with the sound and the choosing device chooses the image reproduction with the sound.

21. A digital camera that records and reproduces images with sound and images without sound, said digital camera comprising:

a selecting device that selects a file of an image from a storage medium storing files of the images with the sound and files of the images without the sound;

a choosing device that chooses between image reproduction with the sound and image reproduction without the sound; and

a reproducing device that reproduces the image and sound when the file selected by the selecting device contains image data of the image with the sound and the choosing device chooses the image reproduction with the sound and

reproduces only the image when the file selected by the selecting device contains image data of the image without sound.
